

SMTA

A distributed platform to monitor and predict stock market behaviour

PROJECT PURPOSE

ADX

Average Directional Index (ADX) is used to calculate the strength of a trend and has a range of values between 0 and 100.

Forecast:

If the ADX value is **lower than 20** this means that the trend is **weak**, on other hand, if it is **greater than 25** the trend is **strong**.

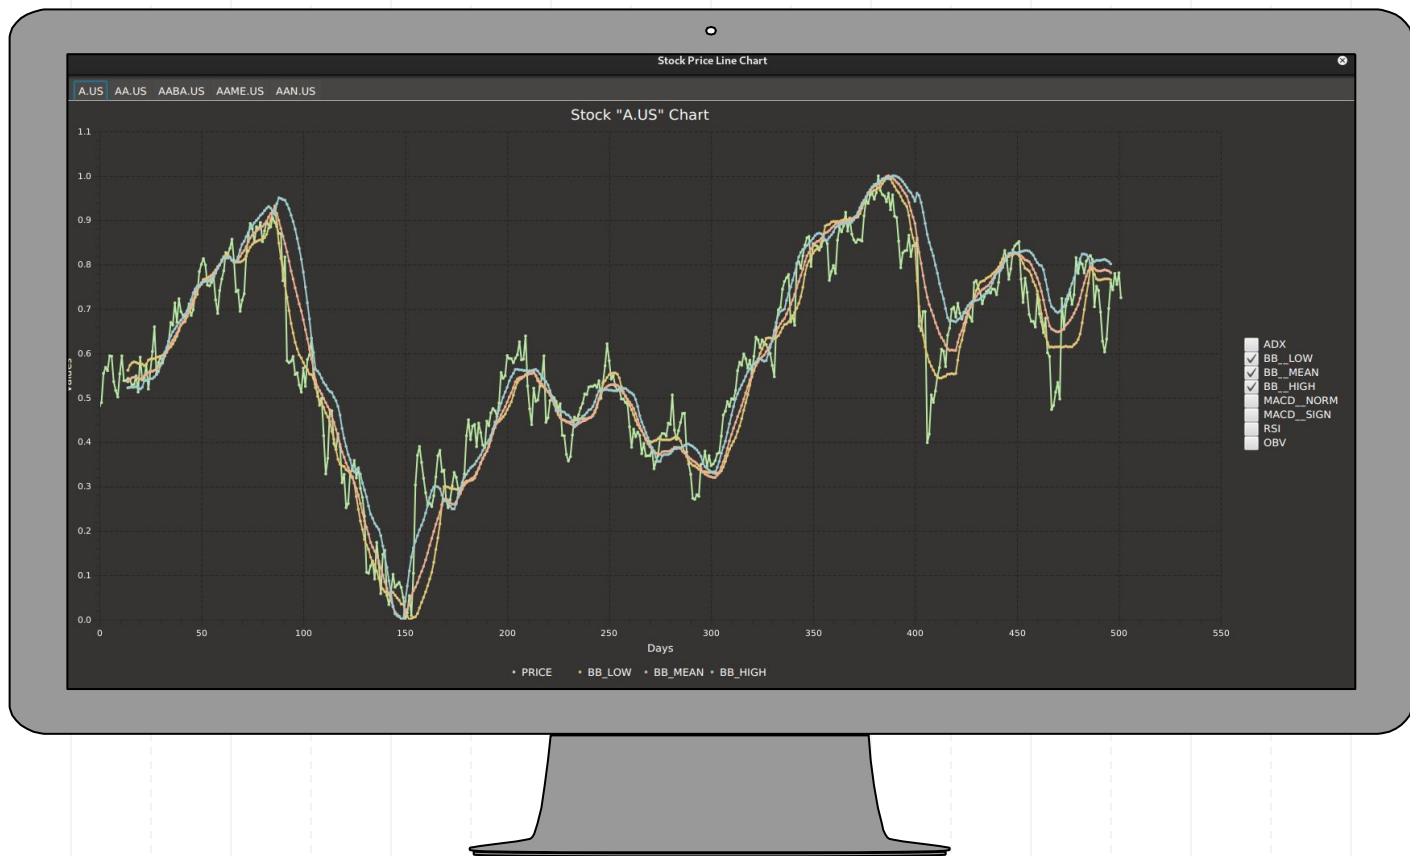

BB

Bollinger Bands (BB) is a composition of three different bands: **low band**, **mean band** and **higher band**. It is used to predict the occurrence of a **negative** or **positive pick** in stock prices.

Forecast:

If the **mean band** touch or exceeds the **higher band** a negative pick will probably occur in the next period, on other hand, If the **mean band** touch or exceeds the **lower band** a positive pick will probably occur in the next period.

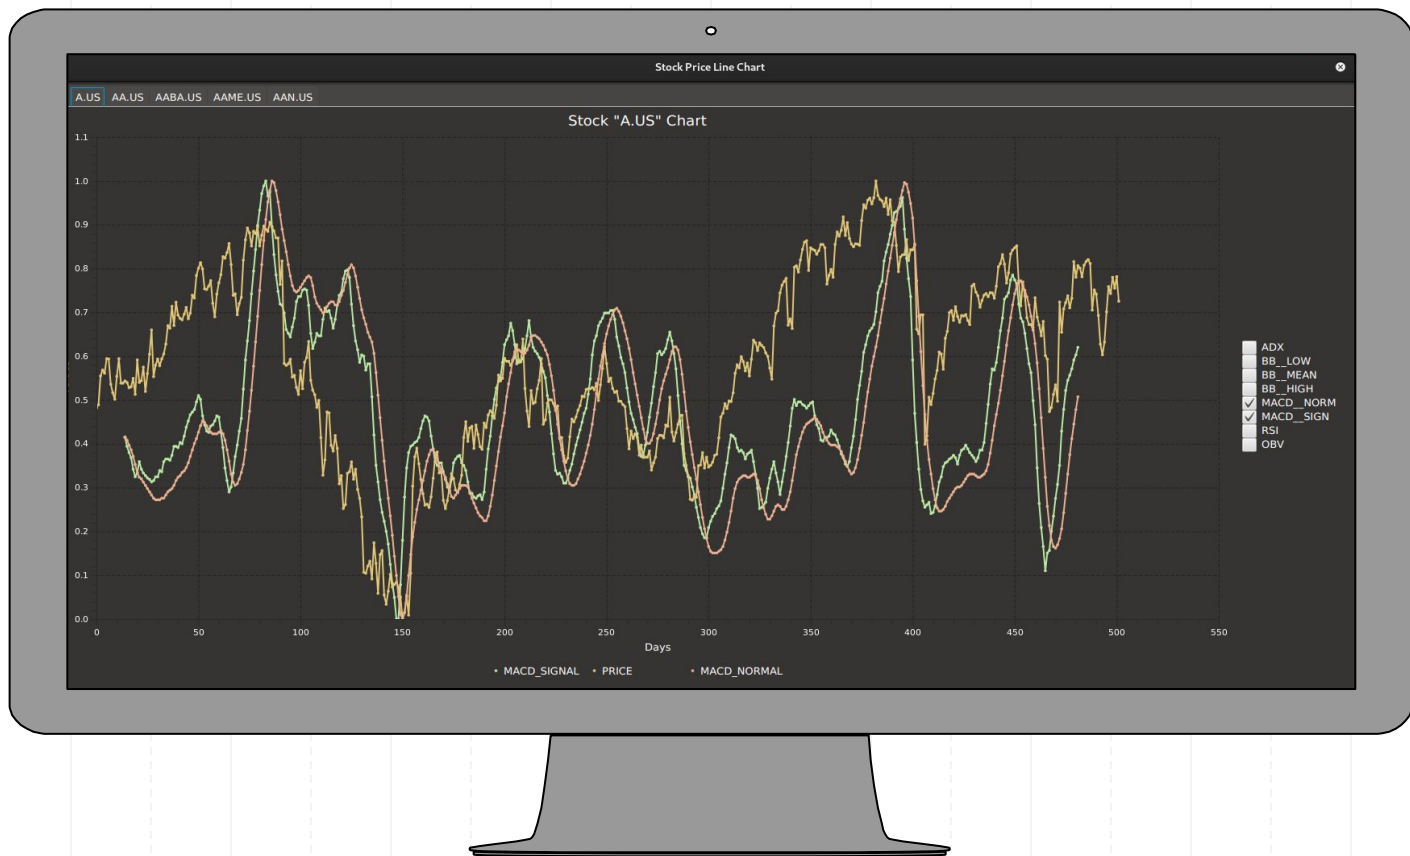

MACD

The **Moving Average Convergence/Divergence** (MACD) is a trend-following momentum indicator that shows the relationship between two moving averages of a security's price. It is composed by two sub-indicators: the **MACD line** and the **signal line**.

Forecast:

When the **signal line** exceeds the **MACD line** there will be, probably, a drop in the stock price, otherwise, there will be a probably an increase.

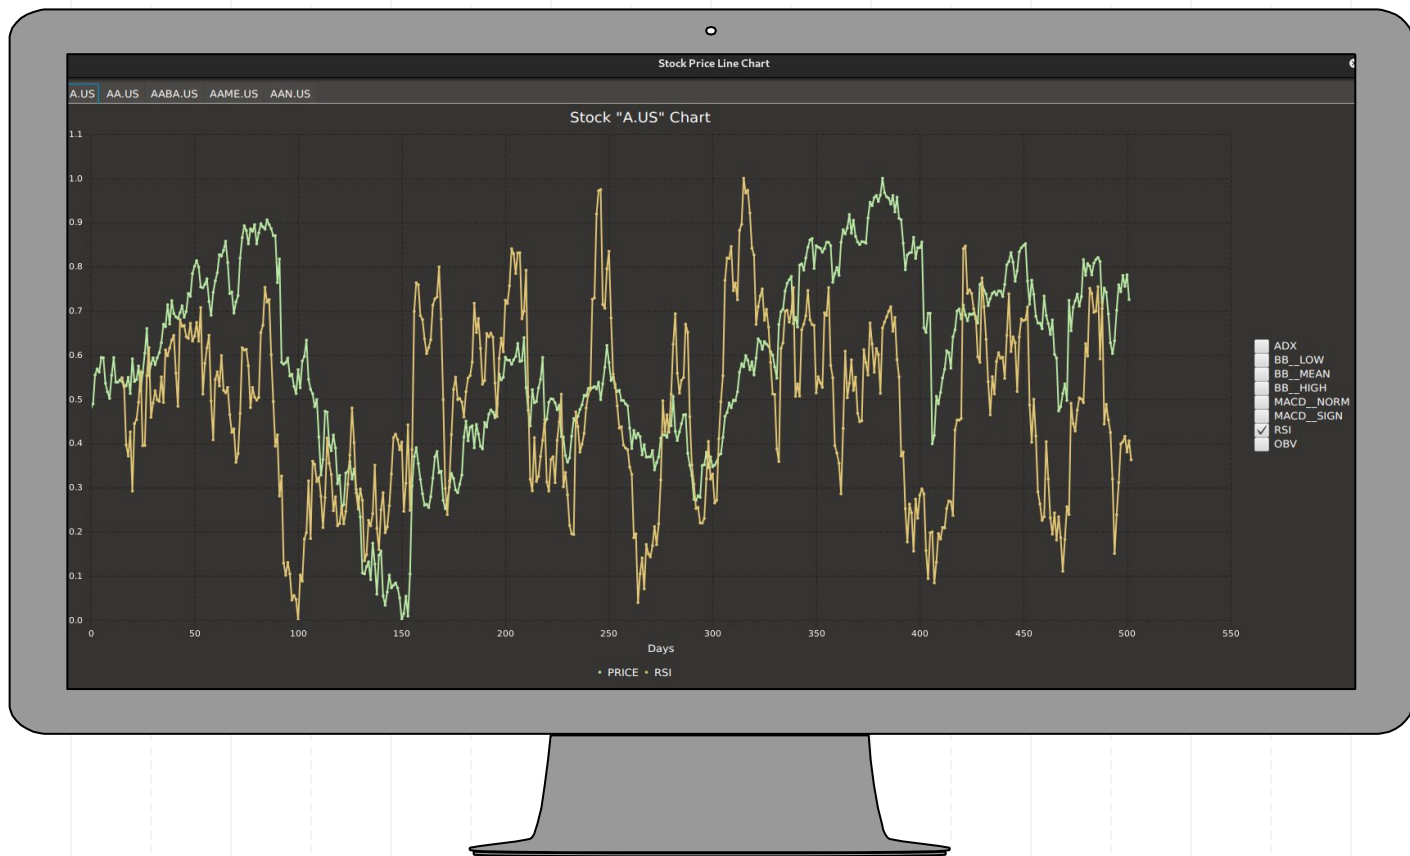

RSI

The **Relative Strength Index** (RSI) is a momentum indicator that measures the **magnitude of recent price changes**. The RSI is an oscillator and can have a reading from 0 to 100.

Forecast:

If the RSI is under **30** the stock is **oversold** and will probably rise in the future. On the other hand, if the RSI is over **70** the stock is **overbought** and will probably fall.

OBV

The **On-balance volume** (OBV) is a technical trading momentum indicator that uses **volume flow** to predict changes in stock price.

Forecast:

If the OBV trend is similar to the price then the trend is strong, otherwise not.

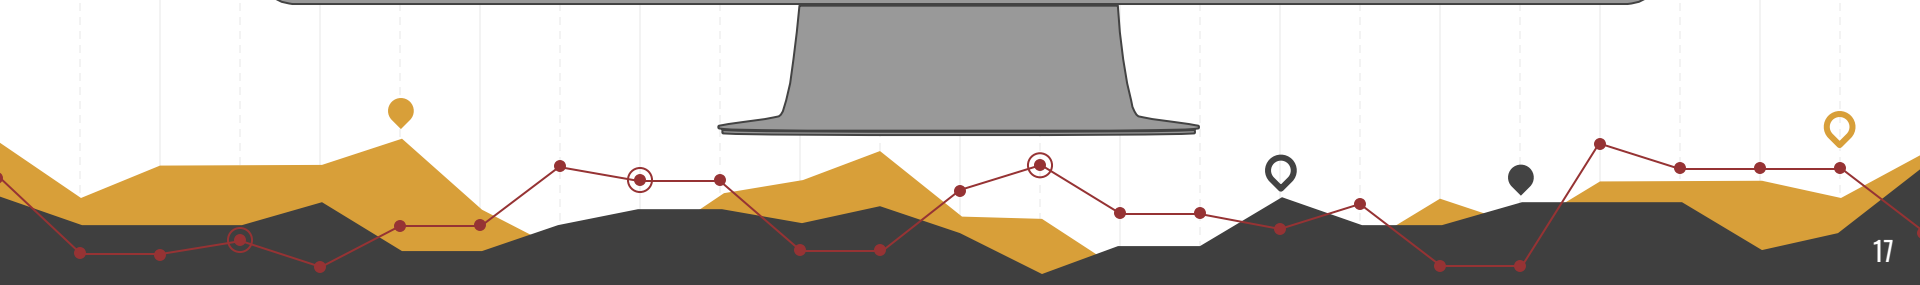

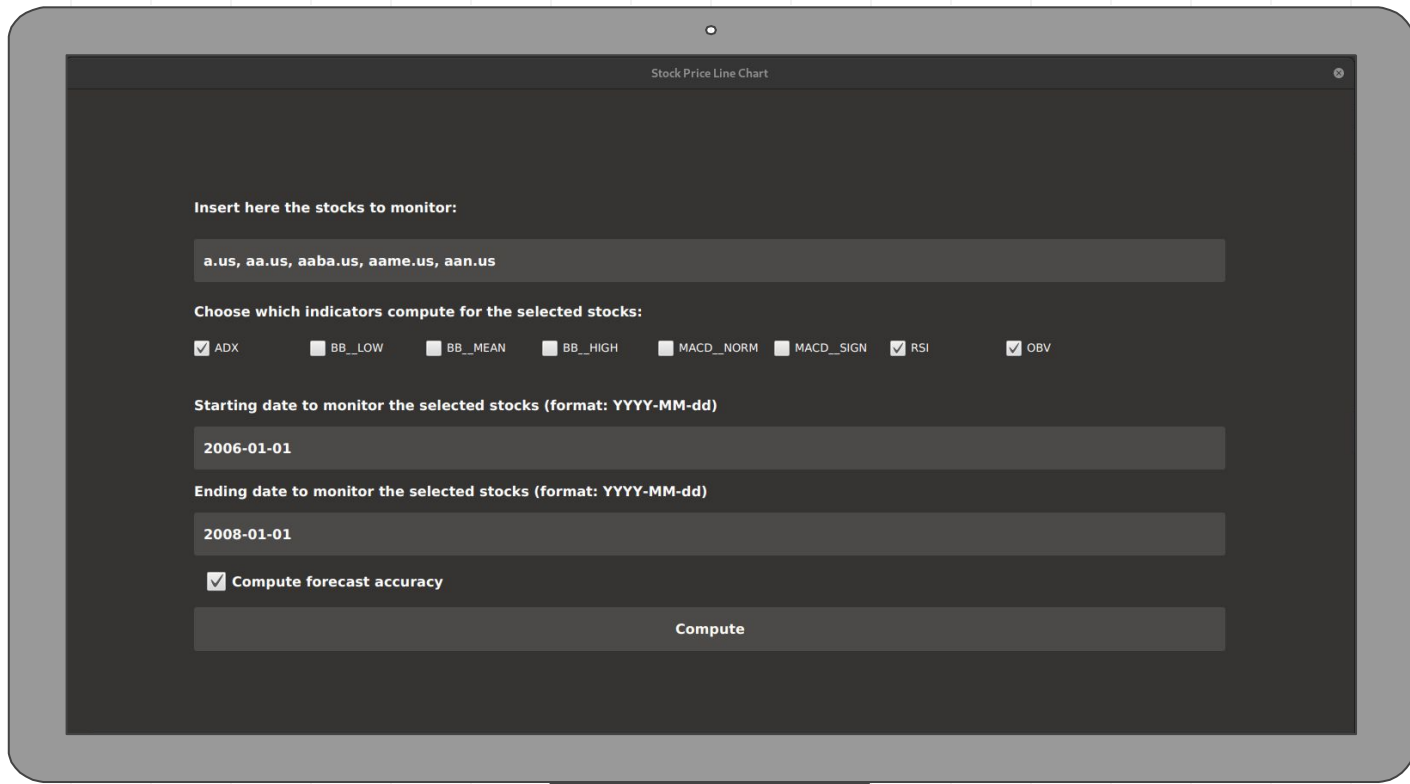

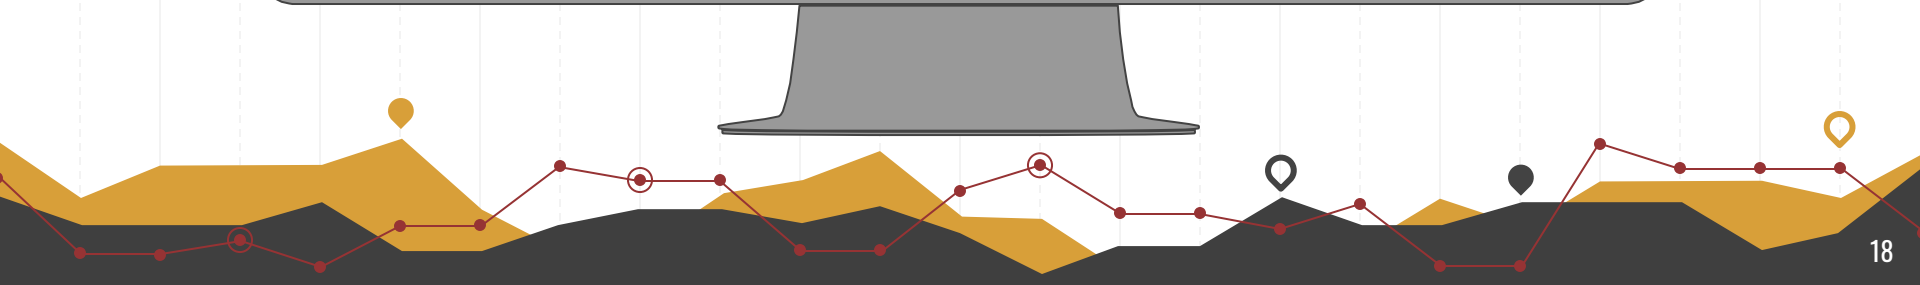

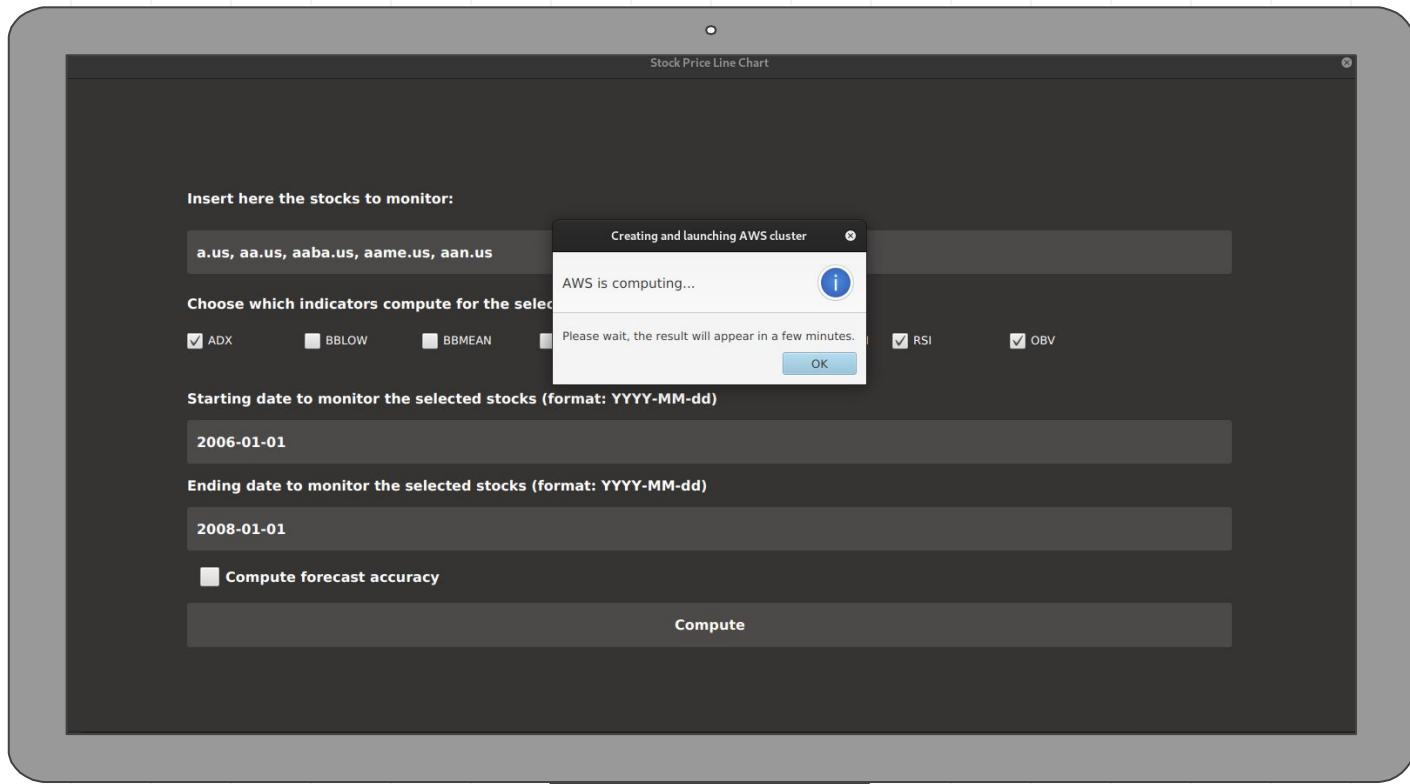

PROJECT ARCHITECTURE

```
aws emr create-cluster --name "SMTA"  
  --release-label emr-5.29.0  
  --instance-type m4.large  
  --instance-count 15  
  --applications Name=Spark  
  --steps Type=Spark,Name="Spark Program",  
    ActionOnFailure=TERMINATE_CLUSTER,  
    Args=[--class,technicalanalysis.MainApp,  
      s3://smta-data/smta.jar,  
      "start_date","end_date",  
      forecast , stocks_list]  
  --log-uri s3://smta-data/log |  
  --use-default-roles  
  --auto-terminate
```

**A FEW
MOMENTS LATER**

Forecast benchmarks 1 stocks

Computation time (in minutes) for 1 stock forecast accuracy

The execution time does not include the warm-up time.

Forecast benchmarks 1 stocks

Computation time (in minutes) for 1 stock forecast accuracy

The execution time does not include the warm-up time.

Forecast benchmarks 5 stocks

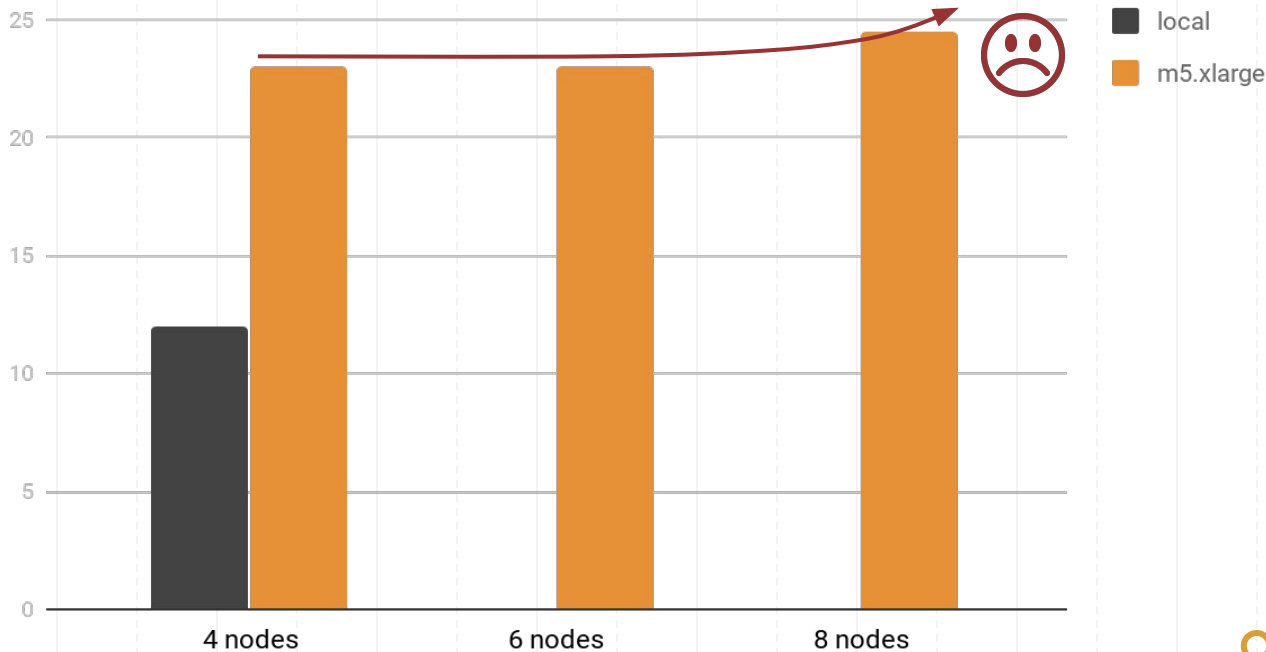

Computation time (in minutes) for 5 stocks forecast accuracy

The execution time does not include the warm-up time.

Forecast benchmarks 5 stocks

Computation time (in minutes) for 5 stocks forecast accuracy

The execution time does not include the warm-up time.

Forecast benchmarks 10 stocks

Computation time (in minutes) for 10 stocks forecast accuracy

The execution time does not include the warm-up time.

Forecast benchmarks 10 stocks

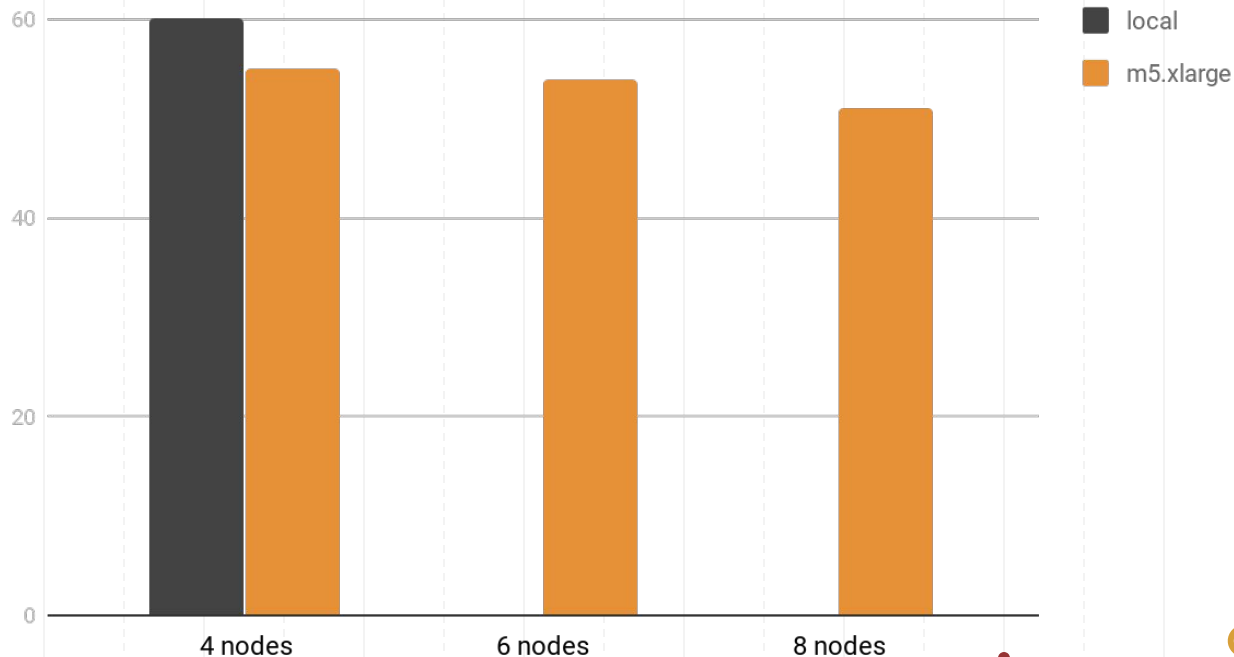

Computation time (in minutes) for 10 stocks forecast accuracy

The execution time does not include the warm-up time.

Indicators benchmarks 3k stocks

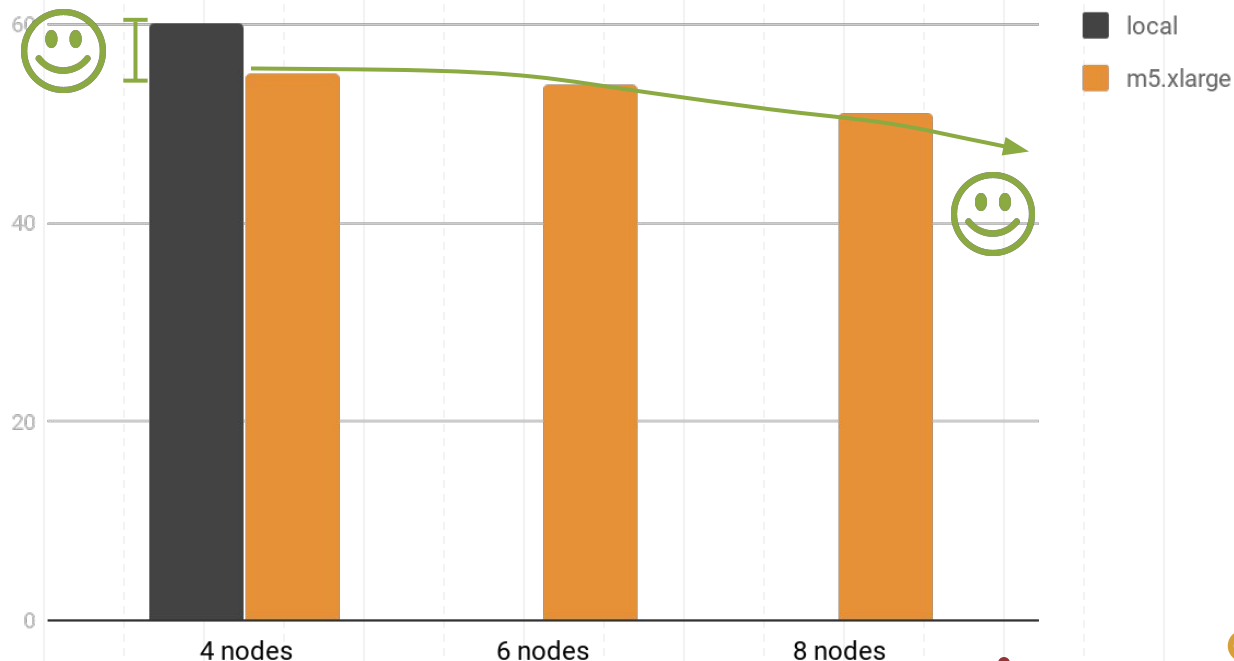

Computation time (in minutes) for 3k stocks indicators

The execution time does not include the warm-up time.

Indicators benchmarks 3k stocks

Computation time (in minutes) for 3k stocks indicators

The execution time does not include the warm-up time.

Conclusions

- The first comparisons between local and cloud forecast performances did not show any improvement. We investigated the reason and found that **it was not the proper way** to analyze the program scalability.
- We then compared the indicators computation on a huge amount of stocks, getting finally a significant **performance improvement** from local to cloud execution. In fact this section was designed to be scalable not the forecast.
- After many Google (and GitHub) searches, we found out that there are **no similar implementations** of our cloud scalable technical analysis application.

THANKS !

Any questions?
